Vials and gnomes, how do they go together?

A justified question. The answer is simple. Both originate from Gräfenroda.

Gräfenroda is home to the Glastechnik Gräfenroda GmbH (GTG) where the GTG vials have been produced since the Wende. And in Gräfenroda gnomes have been lovingly handcrafted since 1874. Furthermore these companies as well as infochroma ag and chemoLine are entirely in family hands. The focus is on excellent product quality and service.

The gnomes have turned into a company tradition and have grown into a family. Gnomes are said to be clever, to possess good manual skills, to be hard working and honest. As virtual personality each gnome has a name. And with a wink we have assigned each of our gnomes with a mission.

2017 - Harry Hygiene

the Supervisor of the Controlled Zone

Gnome protective, Harry Hygiene keeps a close watch over the controlled zone. Under his supervision germs and pyrogenes have no chance of survival.

2011 - Yetino Rodovich

the Guardian of the Pure Sample

The Yeti Gnome watches over the purity of your sample so that it runs smoothly on its way to the analysis result without clogging the channels.

2014 - Carlo Carbon-Chroma - the Family Gnome

Carlo Carbon-Chroma has a C in the centre of a diamond on his jumper. This „C“ stands for the sixth element carbon, the molecular basis for all life on earth. It also represents chromatography and chemoLine and last but not least commitment for cohesion and solidarity within the family.

2010 - Rosa Maria

The Laboratory Lady Gnome

Rosa Maria is the patron saint of the laboratory. She watches over the accuracy of your analysis and protects your laboratory from wrong.

2012 - Fläschli Joseph - the Swiss Wrestling Gnome

Schwingen (Swiss wrestling) is a traditional Swiss contest, a contest of power in fairness and friendship. Thus our Fläschli Joseph represents the fairness in the daily competition of power at work and at home

Chromatography vials for optimised microsampling

Chromatography vials for optimised microsampling

Most chromatography autosamplers use vials with the dimension 12 x 32 mm. An optimised solution is asked for, if only a small amount of sample is available or full recovery of the sample is required.

Most chromatography autosamplers use vials with the dimension 12 x 32 mm. These vials take «2 ml» of sample. If only a small amount of sample is available or full recovery of the sample is required, an optimised solution is asked for. At the same time the vial should not require a support and the standard dimension of the vial should be kept to fit standard autosamplers.

We have 3 different microsampling vials that meet these requirements. There is one important question you have to ask yourself in order to find the right vial for your requirement. How much sample do you have and how much sample do you need for your analysis. The difference between those two, the sample volume that remains in the vial, we call residual volume. And this residual volume tells you which vial you need.

Many competitors talk about the so-called dead volume, the amount of sample that cannot be retrieved from the vial but this volume cannot be easily defined. How far the needle descends into the vial, the geometry of the needle, how much sample is

required to cover the needle hole so that no air is retrieved with the sample, all these aspects define the actual dead volume of an application. We find that giving the dead volume without exact specifications of these parameters does not make any sense.

The residual volume of our vials is defined by the following parameters: the remaining fluid level is at 4 mm from the bottom of the vial, given that normally the needle descends to about 1 - 2 mm above the bottom of the vial and the needle should be covered with at least 2 mm of sample in order to guarantee a reliable sample taking. The actual dead volume of our vials is generally much lower than the assumed fluid level at the bottom of the vial, but if you are using a needle with side hole 4 mm may be too little.

A standard 12 x 32 mm Vial for example has a residual volume of 400 µl.

When to use which one of our 3 micro vials?

the 1.2 ml Vµ-Vial our „Vase Vial“

Our Vase Vial - the Vµ-Vial - has the largest volume. It takes 1.2 ml if filled to the shoulder and it's residual volume is 15 µl.

As the Vase Vial is the most economic solution, we recommend it for all applications with a residual volume of $\geq 15 \mu\text{l}$. The Vase Vial is also the most universal of our three microsampling vials as it is available with all common closure types including the 8-425 screw thread which we call «NM» or «Narrow Mouth» as it has a small opening. The Vase Vial is our own invention and the form as well as the production process is protected by an European patent.

- **small residual volume**
- **no support required**
- **can be used with large and small volumes of sample**
- **available in clear (H) or amber (D) borosilicate glass**

the 250 μ l Insert Vial iV2 μ - also ideal for volatile samples and micro-reactions

Our most recent development is the iV2 μ -Vial where the vial head is on the insert. Thus the insert itself is closed with the cap so that no sample can volatilise into the outer shell of the vial. The body of the vial is a simple shell which is fused with the insert at the bottom. We produce these vials on a one-station machine of our own design which allows us to draw the insert longer and more narrow than with common techniques. The total volume is 250 μ l and the residual volume is 8 μ l. The iV2 μ -Vial is especially suited for volatile micro samples and gas chromatography applications and completes our programme at the bottom end volume vise.

- **insert itself closed with cap** the sample can't escape into the space between insert and outer shell; ideal for micro-reactions, for volatile samples and lyophilisation
- **long narrow pointed insert** also suitable for side-hole needles; very small dead volume (< 5 μ l)
- **established design** outer shell matches 12 x 32 mm standard; no support needed; very robust design

the μ -Vial with fused 350 μ l insert

Our first microvial, historically, is the $i3\mu$ type with a fused insert which forms a common base with the outer vial. In its functionality it is like using vial and insert only that the insert of the μ -Vial is firmly fused with the supporting vial which has

the advantage that the insert fits snug into the vial opening and stands upright without extra support. The total volume is 350 μ l with a residual volume of 10 μ l.

- 350 μ l insert fused into a standard 12 x 32 mm vial
- centred and upright insert
- robust design
- available in clear (H) or amber (D) borosilicate glass

pp-Pure Vial - Polypropylene vial

pp-Pure Vial - Polypropylene vial for sample volumes from 100 - 700 µl

Polypropylene vial which may be used for volumes from 100 - 700 µl.

available as

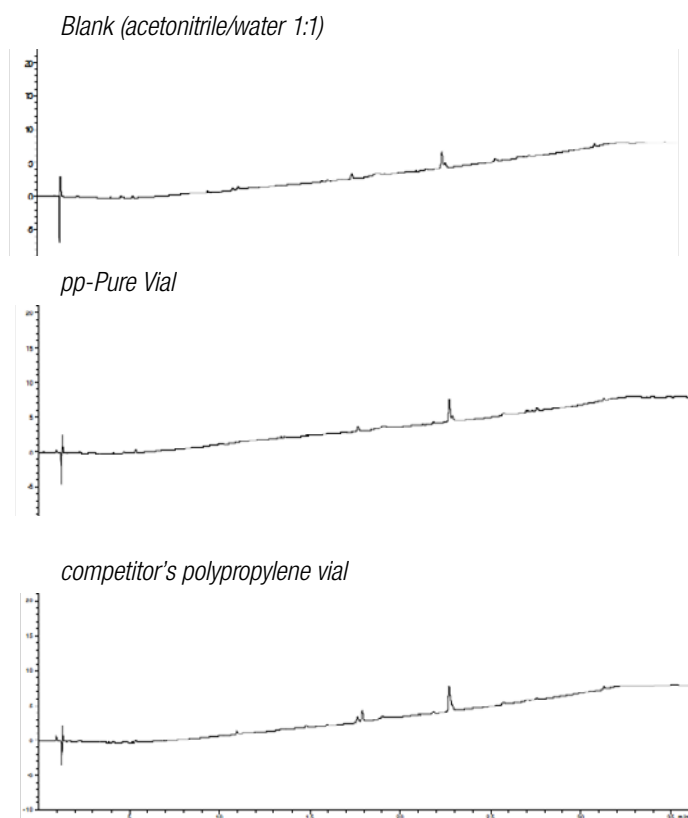

- Crimp Vial and Snap Crimp Vial (see pages 24 & 26)
- Agilent Technologies compatible Screw Vial (see page 28).

Test Conditions:

A pp-Pure Vial and a competitor's polypropylene vial were filled with a mixture of 1 : 1 acetonitrile/water. In addition, the pp-Pure Vial was immersed into a container containing the same solvent. After an incubation period of approx. 24h at room temperature, the solvents in the three containers were analysed for UV-active impurities from the containers' material by means of RP-HPLC.

HPLC-Method:

The extracts were separated by RP-HPLC and an acetonitrile gradient. Detection was carried out in a low UV-range. This screening method allows the recording of a wide spectrum of potential extractable substances. As comparison served a mixture of lead compounds of often used plastic additives with a concentration of approx. 2.5 mg/l. The sensitivity of the method lies at approx. 0.5 mg/l (0.5 ppm).

lead compounds	class of substances
Diethylphthalate	Phthalate (plasticiser)
Butylhydroxitoluole	Phenolic Antioxidants
Tinuvin 328	nitrogenous UV-stabiliser

Time	Mobile Phase A	Mobile Phase B
0 min.	95 %	5 %
30 min.	5 %	95 %
35 min.	5 %	95 %
36 min.	50 %	50 %

HPLC-Conditions:

Column: Nucleosil 120-3 C18 125*4 mm
 Flow: 1.0 mL/min.
 Detection: 220 and 340 nm
 Temperature: 40°C
 Injection Volume: 100 µl
 Mobile Phase A: 0.01 M Phosphorous Acid
 Mobile Phase B: Acetonitrile

pp-Pure Vial - In comparison with the blank there were no additional signals detected, neither in the filled nor in the immersed pp-Pure vial. The two chromatograms were identical.

competitors' polypropylene vial - In comparison to the blank there was a bigger signal in the retention area of 23 minutes.

KapOni-Pure - the septum free Septum Cap G094*-KOP02

With the wide use of MS Detectors and increasing sensitivity, there is an increased problem with ghost peaks in the daily analysis. These ghost peaks have their source in material with which the sample is coming into contact up to detection. One possibility to avoid this problem is the use of our ms-Pure septum, which is considerably cleaner because it is non-pigmented and was specifically developed to guarantee the best results in Chromatography.

But even the ms-Pure Septum can't perform miracles, it is after all still a silicone/PTFE septum. When the needle penetrates the septum, smallest particles of the septum are scraped off into the sample; these particles from the septum material may interfere in GC showing as depolymerised siloxane peaks.

Our solution is the KapOni-Pure a septum free septum, which is moulded from inert and plasticiser free pp-Pure polypropylene. The sealing element is moulded as a funnel with a thin moulded septum at the bottom end of the funnel which seals the vial; even after the seal has been penetrated by the syringe needle, the funnel functions as re-condensation zone so that evaporation is smaller than with standard one-piece PP caps with moulded septum. In addition the needle is guided by the funnel which lengthens the life span of the needle.

G094*-KOP02

9 mm screw cap with sealing element from inert and plasticiser free pp-Pure-polypropylene

ms-Pure - non-pigmented silicone/PTFE septum

ms-Pure septum - non-pigmented silicone/PTFE septum

With the increasing sensitivity of analytical instruments there is an increasing demand for pure low bleed septum material to prevent sample contamination with extractable substances from the septum. The ms-Pure silicone/PTFE septum is produced from natural non-pigmented silicone/PTFE. Tests show that it is over 60 % cleaner than „standard“ silicone/PTFE septums on the market.

Evaluation of overall bleed characteristics using gas chromatography

ms-Pure septum ideal for MS applications:

- non-pigmented low-bleed silicone of highest quality
- resists coring
- excellent re-seal ability
- intended for multiple injections
- low compression set for storage reliability

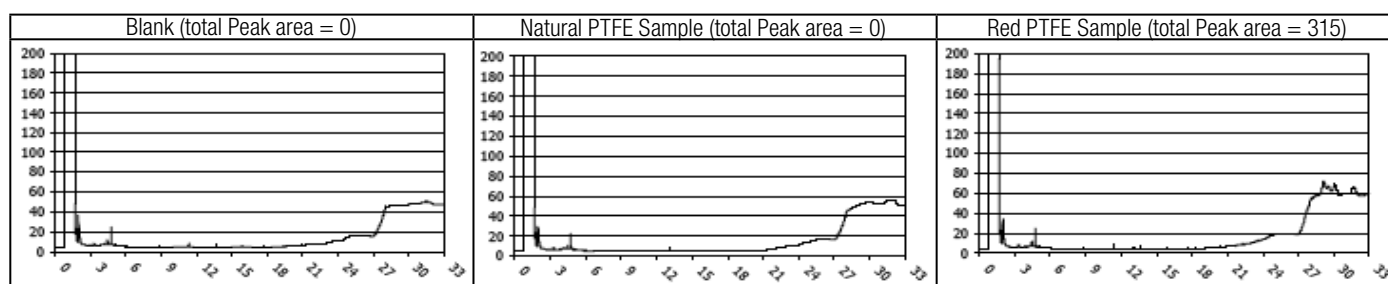

available as:

- silicone/PTFE
- silicone/PTFE pre-slit
- PTFE/silicon/PTFE

Bleed comparison between natural and red PTFE sample using gas chromatography

Intuitively, one would surmise that pigmented materials (i.e. those that are coloured in some way) would be more likely to pose as a contaminant source when compared to materials that are not pigmented. This study compares two (2) 0.01 mm thick samples of PTFE. One is red in colour and the other is non-pigmented or natural. The total peak area illustrates that the natural (non-pigmented) PTFE shows a value of (0) zero, while the red PTFE yielded a total peak area of 315. Using lower bleed materials provides truer readings, eliminates another potential error source, decreases sample contamination, and improves productivity.

Procedure

GC: the septum was extracted in (50 mg/ml) dichloromethane:methanol (50:50) for 24 hours. It was then analysed via GC under the conditions on the right.

For control purposes a blank was carried out after each injection to prevent sample carry over.

Column	Agilent DB-1 30.0 m x 320 µm (19091Z-213)

Pressure	25 psi during 27 Min., 50 psi during 27-33 min.

VMax-Vial - the big „Vase“ for optimised microsampling

We can produce any standard vial up to 60 ml with our patented „Vase“ foot for optimised microsampling.

The VMax-Vial has a cylindrical foot. We chose a „cylindrical foot“ over a „cone foot“ as we think a cylindrical foot is technically superior for the sample taking in an autosampler.

A sampler usually pierces the sealing septum with a needle which descends to a defined height to take the sample. The needle has two functions, to pierce the septum and to withdraw the sample. The needle should be formed so that it easily pierces the septum. If the needle has a bevel tip it must not hit the bottom of the vial or the needle tip will be bent which will negatively influence the further piercing of the septum. If the needle has a cone tip it must not hit the bottom of the vial either as the needle whole could become sealed by the vial bottom so that no sample is taken. If a needle with side hole is used the system may be adjusted so that the needle tip rests on the bottom of the vial but still the needle hole is above the bottom of the vial. Independent of the needle geometry, the highest point at which the sample enters the needle defines the death volume of a vial.

In order to get the maximum sample return, air should usually not be sucked into the needle with the sample. This requires minimal sample coverage over the needle hole. For most samplers, it can be said that the needle descends to a defined level above the intended withdrawing level (commonly 2.5 mm above withdrawing level). As the withdrawing level is at the bottom of the vial, the vial producer must assure that the vial bottom has a reproducible inner height. The dead volume can be derived with the measure that the bottom of the vial has a radius r ($=\varnothing$ foot/2) and the needle hole is above the bottom at height h .

The death volume of the cone version forms a cone stump with the side angle a ; the cylindrical version, as produced by GTG, forms a cylinder.

The death volume of the cone version results in $V_{KS} = \pi \cdot h / 3 (3r^2 + h^2 \tan^2(a) + 2r \cdot h \cdot \tan(a))$

The death volume of the cylindrical version results in: $V_{Zyl} = \pi \cdot r^2 \cdot h$

in this example applies: death volume to needle hole $r = 1.5$ mm, $h = 1.5$ mm and $a = 45^\circ \rightarrow \tan(a) = 1$

$V_{KS} = 21.2 \mu\text{l}$

$V_{Zyl} = 10.6 \mu\text{l}$

This means that the dead volume of the cone version is bigger by a share of $\pi \cdot h / 3 (h^2 \cdot \tan^2(a) + 2r \cdot h \cdot \tan(a))$. With an angle a bigger 45° , $\tan(a) > 1$ and increases considerably. The same results when the needle hole has to be covered with sample. In this case height $h =$ height h (needle above base) + \ddot{u} (coverage with sample).

in this example applies:

death volume to coverage $r = 1.5$ mm, $h = h + \ddot{u} = 1.5$ mm + 2.0 mm = 3.5 mm and $a = 45^\circ \rightarrow \tan(a) = 1$

$V_{KS} = 108.1 \mu\text{l}$

$V_{Zyl} = 24.7 \mu\text{l}$

It can be concluded that in order to minimise death volume $\tan(a)$ one has to aim towards zero which means that a cylindrical solution is an advantage. The actual death volume has to be reduced by the displacement volume of the needle but the influence is the same for both cylindrical and conical and therefore is not shown in this calculation.

We are able to form the foot with a thorn such as is required by the geometry of the needle under the adherence of certain measurements.

VMax-Vial - the big „Vase“ for optimised micro-sampling

- the “big” Vase Vial, volumes up to 60 ml
- stand alone, no support needed
- can be produced in any size up to 60 ml, 35 mm min. vial height required
- available with crimp or screw-top
- ideal for automated sample preparation

Storage Vials from 1.0 - 60 ml with closed-top, PTFE lined screw cap

Our Storage Vial line comprises 6 vial diameters and over 30 different dimensions within the volumes of 1.0 - 60 ml. The vials come assembled with closed-top PTFE lined screw cap and are supplied in a high quality card board box with a grit divider holding 100 vials. The box is also ideally suited for storing or for transportation of the vials.

Beaker

(Product number: 400 ml: 50-1546)

Low form
with handle and beak-shaped
spout, made from
SIMAX®-laboratory glass

various sizes available

12 x 32 mm Crimp vials & caps

G002-CV-H
G002-CV-D

1.5 ml crimp vial,
clear or amber borosilicate glass,
size: 12 x 32 mm

BL02-CV-H
BL02-CV-D

1.5 ml crimp vial with
white write-on patch and graduation,
clear or amber borosilicate glass,
size: 12 x 32 mm

8002-CV-H/V15μ
8002-CV-D/V15μ
1.2 ml crimp Vμ-Vial,
clear or amber borosilicate glass,
15 μl residual volume,
size: 12 x 32 mm

8002-CV-H/iV2μ
8002-CV-D/iV2μ

Crimp iV2μ-Vial, clear or amber borosilicate
glass, with pointed narrow 250 μl insert,
insert directly closed with cap,
8 μl residual volume,
size: 12 x 32 mm

8002-CV-H/i3μ
8002-CV-D/i3μ

Crimp μ-Vial,
clear or amber borosilicate glass,
fused 350 μl insert,
10 μl residual volume,
size: 12 x 32 mm

G002-SC-PP/i17μ

700 μl snap/crimp vial, polypropylene,
may be used for 100 μl - 700 μl,
size: 12 x 32 mm

8002-CV-D/V15μ/BLACK

for light sensitive samples
1.2 ml crimp Vμ-Vial, amber
borosilicate glass with black,
opaque coating,
size: 12 x 32 mm

Aluminium crimp caps

Aluminium crimp caps with rubber/PTFE septum for routine analysis should also have the necessary purity and be produced within the necessary tolerances. We noticed that the cheapest types don't necessarily meet the quality requirements of our customers.

Therefore our standard caps are tested for extractable substances in cooperation with Interlabor Belp, CH. For the convenient handling in the laboratory our caps are supplied in a clear PET screw-top box.

With the increased sensitivity of detectors, there is an increased problem of ghost-peaks sourcing from phthalate and siloxane bleeding from the septum, which is used to seal the vial. Our ms-Pure silicone/PTFE septum minimises the risk of ghost peaks. However, if the source of the ghost peak is siloxane, we recommend the use of an aluminium septum with a PTFE sealing ring to prevent ghost peaks in your analysis.

And we recommend the use of a silicone/aluminium septum, if impurities are dissolved into the solvent through the PTFE because the PTFE is too porous. This occurs especially if the sample is held in the Autosampler over an extended period of time.

Wash vials with clip-in diffusion insert

Autosamplers extracting the sample from the vial with a syringe, need to have the syringe rinsed after each injection to keep sample carryover at a minimum. With increasing sensitivity of the analytical instruments, the rinsing process becomes increasingly important, especially when different or viscous samples are analysed. The vial which holds the rinsing solvent is the so called wash vial.

depth in both the standard vial and the wash vial. Therefore the minimum filling level is marked on the wash vial. On the side of the waste solvent this is in reverse. The syringe should not dip into the waste solvent and the maximum filling level is marked.

Wash vials are in fact normal 4 ml screw vials which are filled with a rinsing solvent. Instead of a septum, the wash vial's screw cap has a funnel, the diffusion insert. The diffusion insert serves three purposes: it closes the vial, it reduces evaporation of the solvent and guides the needle. Common diffusion inserts are loose in the cap and when the vial is opened for filling, the diffusion insert ever so often jumps from the cap, disappearing into a dark corner of the laboratory where it is hard to be found. Our wash vials have a diffusion insert that clips into the screw cap staying in place when the vial is opened to be filled.

2 ml of one wash vial filling can be used, which means if the syringe is rinsed 3 times using 10 µl for each rinse, there is enough rinsing solvent for 65 injections. Even though the wash vial contains clean solvent only, the repeated insertion of the syringe will contaminate the vial and the diffusion insert. Therefore we recommend to exchange the wash vial regularly, latest after 100 injections. The same applies for the waste vial, which however can be used longer. Our wash vials are supplied in practical sets of 100 pcs, the screw caps of the solvent vials are yellow, red, green and blue, those for the waste vial are black and white.

A standard vial is 32 mm in height while the wash vial is 45 mm, therefore a good part of the solvent in the wash vial cannot be used; for naturally the syringe descends to the same

4 ml Wash vial kit

Our wash vials are supplied in a practical kit of 100 pcs, the solvent vials have screw caps in yellow, red, green and blue; the waste vials have screw caps in black and white.

Crimpronic - electronic crimper

for the effortless and reproducible crimping of crimp vials

The Crimpronic is an electronic crimper, in which the vial is placed with cap in place. The crimp head descends onto the vial and an electronic cylinder crimps the cap with a predefined pressure. As the Crimpronic crimps with a predefined pressure rather than against a mechanical stop, which is the case with manual crimping tools, the Crimpronic even compensates the tolerance of the glass and the septum thickness. This guarantees that one closure is identical to the next.

The Crimpronic is not faster than a manual crimper but produces much more reproducible and uniform results particularly when working with difficult closures like lyophilisation stoppers or magnetic metal caps.

Crimp heads are available for all standard cap sizes and are exchangeable by hand.

De-crimp heads for the opening of vials are also available.

We recommend the use of the Crimpronic:

- ☛ for reproducible crimping
- ☛ when the quality of the crimping is critical
- ☛ for closures that are difficult to crimp such as lyophilisation stoppers or magnetic steel caps
- ☛ if tenosynovitis has been an issue

Also available with rotary disc

Hard-polyethylene vial racks

When placing an order for vial racks, please quote the vial diameter you are using.

The following maximum number of positions is possible with a vial diameter of:

vial ø	PEWP conforms to well plate	PE32 248 x 114 x 30 mm	PE10 165 x 60 x 30 mm
up to 16 mm	6 x 4 Positions	max. 13 x 6 Positions	max. 8 x 3 Positions
up to 22 mm	-	max. 10 x 4 Positions	max. 6 x 2 Positions
up to 34 mm	-	max. 6 x 3 Positions	max. 4 x 1 Positions

vial ø	rack positions	rack size	product no.
10 mm	24 Positions	PEWP: 184 x 84 x 30 mm	8230-PEWP-24/10
12 mm	10 Positions	PE10: 165 x 60 x 30 mm	8230-PE10-10/12
12 mm	32 Positions	PE32: 248 x 114 x 30 mm	8230-PE32-32/12
15 mm	32 Positions	PE32: 248 x 114 x 30 mm	8230-PE32-32/15
19 mm	32 Positions	PE32: 248 x 114 x 30 mm	8230-PE32-32/19
23 mm	18 Positions	PE32: 248 x 114 x 30 mm	8230-PE32-18/23
27 mm	18 Positions	PE32: 248 x 114 x 30 mm	8230-PE32-18/27

Headspace vials & caps

Headspace screw vial with magnetic screw cap

Headspace chromatography requires the vial to be tightly sealed and the closure to withstand pressure. This requires some effort and is tiring when closing larger series. Our screw-top headspace vial only requires a torque < 1 Nm for a pressure tight seal while common solutions require a torque > 8 Nm.

Our screw caps not only close smoothly, they also have a smaller diameter than aluminium crimp caps for Headspace. Because of the smaller diameter the septum, which is the cost defining factor, is therefore less expensive.

Design Registration No.: DE 20 2007 008 595.8;

Septum Vials from 1.0 - 60 ml complete with open-top screw cap with silicone/PTFE septum

Our Septum Vial programme comprises 6 vial diameters and over 30 different dimensions within the volumes of 1.0 - 60 ml. The vials come complete with open-top screw cap with silicone/PTFE septum; the caps are available in six different colours.

Septum Vials are supplied in high quality card board boxes with a grit divider for 100 vials. These boxes are also ideally suited for the storing or transportation of the vials.

Barcoded Vials & V μ -Vials consecutively numbered from 1 to 100

Barcoded Vials

Barcode labelling facilitates sample handling. The information about the sample contained in the barcode can be quickly identified and automatically recorded.

A barcode digitalises information (yes/no) and depicts it with the aid of dark bars in varying width and light spaces (gaps). Depending on the barcode the gaps or the ratio between bar/gap contain information as well. The ratio between narrow and wide bars is standardised and usually lies between 1 : 2.5 - 1 : 3.5.

Before and after the code is a free space called the quiet zone, which is required for a correct decoding of the barcode.

Before and after the quiet zone are start and stop signs which indicate the scan direction.

A barcode can store multiple information on a relatively narrow space such as sample compounds, information about the synthesis, toxicity, storage conditions and more.

In order for the scanner to read the barcode correctly it may not be smudged. Therefore a solvent resistant label is recommended which for additional protection can be laminated.

Barcode Labels

- ☛ Barcode labels can be designed to customer specification. It is for example possible to include the company logo on the label.
- ☛ Labels are available for vials starting from 2 ml volume.
- ☛ We supply the label applied to the vial or the label only.

Barcode Laser Printing

- ☛ The barcode is applied to the vial with a laser printer.
- ☛ Barcode and 2D Matrix Code are possible.

infochroma's controlled zone for sterile and depyrogenated vials & closures

Since June 2015, infochroma has a controlled zone, where vials and closures may be washed, sterilised, depyrogenated, all according to customer specifications.

Since moving to larger premises in the summer 2016, we have a much larger controlled zone so that we can also swiftly produce large series tailored to customer needs.

This we can do:

- Purified water rinse (de-ionised / de-mineralised water)
- packing in low-particle environment
- hot air sterilisation
- hot-air depyrogenisation
- E-Beam sterilisation in co-operation with contract partners
- individual pack sizes
- individual combination of products per unit
- production of small or large quantities

Quality control

- Validated process
- Skilled staff
- IQ/OQ - equipment qualification, rotative PQ
- Visual inspection for visual defects of 100 % of the finished products
- Analysis for sterility and BET test (bacterial endotoxin-test) carried out by an independent accredited microbiology laboratory
- Detection limit BET: <math><0.001\text{ EU/ml}</math>
- Long term objective: GMP accreditation

Specifications of the controlled zone

Specifications for structure and infrastructure

The demand on infrastructure, equipment, work process and personnel is high in a controlled zone. The specifications for structure and infrastructure have to be strictly observed in order to achieve the quality required of a controlled zone product.

The controlled zone has to be separated from the office and warehouse area by a sluice area. This spatial separation minimises the risk of contamination through germs.

It is also indispensable that all surfaces, including walls, ceiling, equipment and so forth, in the controlled zone as well as the sluice area can be completely disinfected. In addition, the air in the controlled zone is cleaned by HEPA filters and the ambient air is controlled by an air conditioner.

Monitoring of material / flowing of goods / storing of finished products

Storing material in an aseptic environment is essential for achieving the required quality of a controlled zone product. infochroma stores all required material exclusively in the sluice area.

Alongside, we introduced a strictly separated goods flow system which allows us to visually and accurately identify the current status of a controlled zone product. The finished product is stored protected from light, in ambient temperature and a particle free area until delivery to the customer.

As of summer 2016, the finished products will be stored at a controlled and stable temperature in the controlled zone. The shelf life of a controlled zone product is two years from date of production.

Controlled zone staff

The controlled zone production at infochroma is exclusively operated by trained personnel.

Trained personnel only is allowed to enter the controlled zone.

Access to the controlled zone is only allowed to personnel wearing protective clothing.

Machine park:

Work process, equipment, quality control and lot specific certificate

Rinsing of the product in the lab washer

The actual cleaning process starts with the rinsing of the products in the lab washer. The products are rinsed with DI-water < 50 µS (deionised, demineralised water). On customer request the rinsing with other DI water values is possible.

Packing under LAF

Afterwards the rinsed products are packed in an SBS (sterile barrier system) under LAF (LAF Flow Box).

Thermal process / labelling

The thermal process takes place in the steriliser.

Finally the product is labelled. The label holds the following information:

- Product number
- Product name
- Pack size
- Lot number
- Production date
- Expiration date

Quality control / lot specific certificate

After the final visual inspection of one hundred per cent of the finished product, samples of each lot are sent to an independent accredited microbiology laboratory, which analyses the samples for sterility and undertakes the BET (bacterial endotoxin test). Only after the laboratory has confirmed that the test results comply with the requirements, the cleaned products held in the quarantine area are released for sales together with a lot specific certificate.

Sterile & depyrogenated vials and closures from the in-house controlled zone

Process	Typical Application	Description
Depyrogenation validated 3-log reduction	Injectable or parenteral drugs, lyophilisation, final packaging prior to drug delivery, stability studies, clinical trial	Depyrogenation destroys and removes endotoxines. Endotoxines are fever producing substances which are found in the cell wall of certain bacteria. Depyrogenated products have reduced endotoxin content by at least 99.9%.
Steam Sterilisation	Injectable or parenteral drugs, lyophilisation, final packaging prior to drug delivery, stability studies	Sterilization involving steam, heat and pressure to destroy all viable forms of life, including bacterial spores to an acceptable sterility assurance level (SAL) of 10^{-6}
Irradiation	Injectable or parenteral drugs, lyophilisation, final packaging prior to drug delivery, stability studies, clinical trials	A radiation dose sufficient to destroy all viable forms of life including bacterial spores, is applied to an acceptable sterility level (SAL). A typical radiation dose is 25-40 kGy, which produces the required SAL of 10^{-6}

In the infochroma controlled zone we clean, sterilise and depyrogenise (endotoxin content < 0.05 EU/ml) vials and closures according to customer specifications. It can also be specified how many pieces of a product and what combination of products an individual sachet should contain. All products are supplied with a lot specific certificate.

On the next pages you find an extract from our controlled zone product range.
For customer specific products please contact: anfrage@infochroma.ch.

3 ml crimp vial with 13 mm crimp head & closures

		GPEZ-16/035-H GPEZ-16/035-D	3 ml crimp vial with 13 mm crimp head, clear or amber glass, dimension 16 x 35 mm, individually sealed, sterile & depyrogenated, including lot specific certificate
		GPEZ-3T0	13 mm aluminium crimp cap with tear-off seal, individually sealed, sterile & depyrogenated, including lot specific certificate
		GPEZ-3Bu	13 mm grey butyl rubber stopper, individually sealed, sterile & depyrogenated, including lot specific certificate

HPLC Syringe filter and accessory

All Yeti filter diameters and membranes are available with pore sizes from 0.1 μm to 10 μm .

For conventional Chromatography we recommend a pore size of 0.45 μm , for UHPLC pore sizes from 0.22 μm or 0.1 μm .

Which filter diameter for which sample volume?

HPLC syringe filter

HPLC syringe filter with Nylon membrane

for the filtration of:

water, aqueous solvents, alcohol, bases, aromatic hydrocarbons, THF

The Nylon membrane is extremely low in extractables and mechanically very strong. It possesses good thermal stability up to 50°C and is a good all-round filter for HPLC samples. It is a naturally hydrophilic membrane that provides broad compatibility with aqueous and organic samples.

incompatible with:

acids, halogenated solvents, protein samples with high non-specific binding affinities

When ordering Yeti filter please note that:

filters with product numbers printed in blue are available ex stock, subject to prior sale;
other filters have a standard delivery delay of at least 2 weeks.

HPLC syringe filter with regenerated cellulose membrane

for the filtration of: proteins, peptides and other biomolecules

Regenerated cellulose is a hydrophilic solvent resistant membrane. It is a very low protein binder and is ideal for low nonspecific binding applications; tissue culture, media filtration and general biological sample filtration.

incompatible with: acids, chloroform, THF

HPLC syringe filter with Polypropylene membrane

for the filtration of: acids or bases, general HPLC analysis

Hydrophilic polypropylene membranes are chemically resistant and suitable for a wide variety of organic and aqueous based samples. They are low protein binders and can be used with strong acids and bases without prewetting.

incompatible with: Hexane, Toluene, Benzene, limited resistance to MeCl and Chloroform

HPLC syringe filter

HPLC syringe filter with PTFE membrane

for the filtration of: aggressive solvents, strong acids, alcohols, bases, aromatics

Polytetrafluoroethylene (PTFE) membranes are chemically resistant to nearly all solvents, acids and bases. The membrane has low extractables and a good thermal stability. PTFE is hydrophobic and requires pre-wetting prior to use with aqueous solvents.

The **Yeti filter** is also available with a **hydrophilic PTFE Membrane** which can be used with water, aqueous samples and aqueous solvents.

incompatible with: hydrophobic PTFE with aqueous Samples without pre-wetting of filter

other filters have a standard delivery delay of at least 2 weeks.

HPLC syringe filter

HPLC syringe filter with Polyethersulfone membrane

for the filtration of: strong bases, alcohols, proteins, peptide

Polyethersulfone is a hydrophilic membrane with very low protein binding and high flow characteristics. It is also certified for ion chromatography. Polyethersulfone is more heat resistant than most membranes, and can be used to 100°C.

incompatible with: concentrated acids, MeCl, chloroform, hexane, acetone, MEK, THF, DMSO

www.chemoline.ch

Erlenmeyer flask

(Product number: borosilicate glass, 100 ml: 50-2603)

- various glass qualities available (Duran® or borosilicate)
- with or without graduation
- various models and volumes

www.chemoline.ch

Galileo thermometer with 6 bulbs

(Product number: aluminium bulbs filled with blue liquid: 55-1180)

- various colours available
- height 42 cm
- temperature range + 18°C bis + 28°C
- weight 800 g

HPLC syringe filter

HPLC syringe filter with Mixed Cellulose Ester (MCE) or Cellulose Acetate (CA) membrane

for the filtration of: aqueous samples

low protein-adsorption, hydrophilic membrane

incompatible with: *organic solvents*

Filtration volume	up to 2 ml	up to 10 ml	up to 30 ml	up to 100 ml	up to 150 ml	up to 200 ml
Sample loss	< 15 µl	< 25 µl	< 29 µl	< 50 µl	< 137 µl	< 137 µl
Filter ø	4 mm	13 mm	17 mm	25 mm	30 mm	33 mm

When ordering Yeti filter please note that:

filters with product numbers printed in blue are available ex stock, subject to prior sale;
other filters have a standard delivery delay of at least 2 weeks.

HPLC syringe filter with Polyvinylidene Difluoride (PVDF) membrane

for the filtration of: alcohol, weak acids, proteins, peptides and other biomolecules

Polyvinylidene Difluoride is a hydrophilic membrane that is suitable for most general biological sample filtration. It has a broad chemical compatibility and is a low protein binder and so a good choice where high protein recovery is required.

incompatible with: strong acids, bases, ketone

The chemist's coffee maker

(Product number: 57-0023)

Chemistry lifestyle
in the coffee kitchen:
1 laboratory style coffeepot
1 powder funnel made of glass
10 laboratory style folded filters
1 petrid dish
2 laboratory style coffee mugs

Monitoring and Safety by Migration Analytics

In the EU, the standards of the EU regulation 1935/2004 (Article 3)- apply for packaging that comes into direct contact with food. In Switzerland this provision corresponds with Article 49 LGV which says that:

Materials and articles must not transfer their constituents to food in quantities which could:

- endanger human health or
- bring about an unacceptable change in the composition of the food or
- bring about a deterioration in the organoleptic characteristics thereof

Migration Cell System Sieg-Mi-Flex

The modular and flexible migration cell system Sieg Mi Flex (EN standard 1186-1, EC-Regulation 1935/2004 as well as 10/2011 and 2016/1416) is used for the easy sample preparation for analytical or organoleptic migration testing from substance, "Extractables und Leachables" (E&L) and MOSH/MOAH in food simulants, or pharmaceutical formulations.

The Migration cell System-Siegwerk is available in different material:

- Stainless steel (VA 1.4571)
 - Borosilicate glass and
 - PVA coated stainless steel (on request)
- the different material can be combined
 - high temperature resistance (-15° to +180°C), pressure-tight up to 9 bar
 - may be used for liquid food simulants and test conditions above the boiling point
 - quick adaptation to sample areas of different sizes using reduction plates
 - may be equipped with 2 packaging samples (top/bottom)
 - with 1 test specimen stored lying horizontally; with 2 test specimens stored standing upright
 - easily opened and closed thanks to stainless steel knurled nut
 - Test setup in sandwich-format possible
 - compact space-saving design, horizontal or vertical storage
 - the advantage of a migration cell is that the one-sided contact can be simulated without the interference of a cut sample edge or other disturbing effects

Migration-cells

Stainless steel migration cell Sieg-Mi-Flex

- temperature resistant from -15°C to +180°C
- pressure-tight up to 9 bar
- the best selling migration-cell

Stainless steel central ring consisting of:

- 1x stainless steel centring ring with cast-in and cast-out connecting pieces with GL14 threads
- 2x FEP/silicone O-rings that fit in the central ring's groove (top and bottom)
- 2x GL 14 seal caps (PPS housing incl. PTFE/silicone gasket)
- 1x positioning aid made from 2 mm stainless steel (except DN 120)

Stainless steel fixing plate set consisting of:

- 1x stainless steel upper plate with holes, polished inside, 140 x 140mm
- 1x stainless steel lower plate with threaded holes (M8), polished inside, 140 x 140mm
- 4x stainless steel threaded pins (M8) with knurled nut
- 4x stainless steel Sieg-Mi-Flex washers
- 4x PTFE feet, white

Suitable for simulants; A, B, C, D1, D2, Isooctan, Ethanol 95% and alternative simulants which do not chemically attack stainless steel (V4A 1.4571) PTFE / FEP

Stainless steel migration cell	Nominal size	Approx. contact area 1 test specimen / 2 test specimen	Fill volume with 2 test specimens	Product number
Stainless steel fixing plate set				8LZ250-0239899
Central ring	DN120	1.0 / 2.0 dm ²	ca. 200 mL	8LZ250-0235693
Central ring	DN80	0.50 / 1.0 dm ²	ca. 100 mL	8LZ250-0218672
6 additional central ring sizes available (on request)				

Glass migration cell Sieg-Mi-Flex

- temperature resistant from -15°C to +130°C
- pressure-tight up to 1 bar

Glass Central ring consisting of:

- 1x borosilicate glass central ring, with cast-in and cast-out fittings with GL14 threads
- 2x FEP/silicone O-rings that fit in the central ring's groove (top and bottom)
- 2x GL 14 seal caps (PPS housing incl. PTFE/silicone gasket)

Glass fixing plate set consisting of:

- 2x borosilicate glass plates with bore holes, protective inserts for screws
- 4x stainless steel screws (M8) with stainless steel knurled nut
- 4x PTFE-feet with threads, white (M8)

Glass migration cell	Nominal size	Approx. contact area 1 test specimen / 2 test specimen	Fill volume with 2 test specimens	Product number
Glass fixing plate set				8LZ250-0277594
Glass central ring	DN120	1.0 / 2.0 dm ²	ca. 200 mL	8LZ250-0277600

Combination of stainless steel migration cell Sieg-Mi-Flex with glass central ring

- ☛ temperature resistant from -15°C to +180°C
- ☛ pressure-tight up to 4 bar

Glass central ring consisting of:

- ☛ 1x borosilicate glass central ring, with cast-in and cast-out fittings with GL14 threads
- ☛ 2x FEP/silicone O-rings that fit in the central ring's groove (top and bottom)
- ☛ 2x GL 14 seal caps (PPS housing incl. PTFE/silicone gasket)

Stainless steel fixing plate set consisting of:

- ☛ 1x stainless steel upper plate with threaded holes, polished inside, 140 x 140mm
- ☛ 1x stainless steel lower plate, threaded bore hole (M8), polished inside, 140 x 140mm
- ☛ 4x stainless steel screws (M8) with knurled nut
- ☛ 4x stainless steel washers Sieg-Mi-Flex
- ☛ 4x PTFE-feet, white

Stainless steel migration cell and glass central ring	Nominal size	Approx. contact area 1 test specimen / 2 test specimen	Fill volume with 2 test specimens	Product number
Stainless steel fixing plate set				8LZ250-0239899
Central ring	DN120	1.0 / 2.0 dm ²	ca. 200 mL	8LZ250-0277600

Combination of glass migration cell Sieg-Mi-Flex with stainless steel central ring

- ☛ temperature resistant from -15°C to +180°C
- ☛ pressure tight up to 1 bar

Stainless steel central ring consisting of:

- ☛ 1x Stainless steel central ring, with cast-in and cast-out fittings with GL14 threads
- ☛ 2x FEP/silicone O-rings that fit in the central ring's groove (top and bottom)
- ☛ 2x GL 14 seal caps (PPS housing incl. PTFE/silicone gasket)
- ☛ 1x positioning aid made from 2 mm stainless steel (except DN 120)

Glass fixing plate set consisting of:

- ☛ 2x Borosilicate glass plates with bore holes, protective inserts for screws
- ☛ 4x Stainless steel screws (M8) with knurled nut
- ☛ 4x PTFE-feet with threads, white (M8)

Glass migration cell and stainless steel central ring	Nominal size	Approx. contact area 1 test specimen / 2 test specimen	Fill volume with 2 test specimens	Product number
Glass fixing plate set				8LZ250-0277594
Central ring	DN120	1.0 / 2.0 dm ²	ca. 200 mL	8LZ250-0235693
Central ring	DN80	0.50 / 1.0 dm ²	ca. 100 mL	8LZ250-0218672
6 additional central ring sizes available (on request)				

**This is a summary of the migration cell assortment and its possibilities.
For further information about migration cells please contact us.
We will be happy to discuss the possibilities with you in your laboratory.**

Sandwich arrangement without / with centring ring

A sandwich arrangement (doubling the reaction chamber to achieve two high density reaction chambers) requires a second central ring and extension screws (grub screws). An optional centring ring and positioning aids are available.

Centring ring	Nominal size	Product number
Centring ring	DN120	8LZ250-0591782
Extension screws (required) 4 pcs. 109 mm		8LZ250-0584258

Reduction plates

The Sieg-Mi-Flex migration cell system includes 8 standard central rings of various sizes. In practice there are test specimens which require a down-sizing of the central ring to match the test specimen precisely. A fast and cost-efficient solution offer the 3 different stainless steel reduction plates which are used with the larger central rings only. It is also possible to use two reduction plates together with a larger central ring.

Reduction plates (RP)	Nominal size	Approx. contact area 1 test specimen + RP 2 test specimen + 2 RP	Fill volume with 2 test specimens + 2 reduction plates	Product number
Reduction plate (*only with central ring DN60)	DN50*	0.19 / 0.38 dm ²	ca. 55 ml	8LZ250-0584210
FEP/silicone O-ring DN50	DN50			8LZ250-0584241
2 additional reduction plates sizes available (on request)				

Tenax® / Oil-Kit

- ☛ temperature resistant from -15°C to +180°C
- ☛ pressure-tight up to 1 bar
- ☛ this cell design takes one test specimen (on bottom) and is set up horizontally

In addition to tests using Tenax®, the Tenax® / Oil-Kit is also used for migration tests with vegetable oil as it may be found it easier to clean the fixing plate with the GL45 fitting in the dishwasher than a central ring with GL14 cast-in and cast-out fittings.

Tenax® / Oil-Kit	Nominal size	Approx. contact area 1 test specimen	Fill volume max.	Product number
Borosilicatglass upper fixing plate with centric GL45 fitting				8LZ250-0649049
Stainless steel central ring	DN120	1 dm ²	ca. 220 mL	8LZ250-0591775
Borosilicate glass central ring	DN120	1 dm ²	ca. 220 mL	8LZ250-0649100
Srew cap GL45, PPS housing incl. PTFE/silicone gasket				8LZ120-0649056
